

Internship Report

Task 1: Netflix Content Recommendation System

Introduction

In this task, I developed a Netflix Content Recommendation System using Machine Learning. The goal is to recommend similar Netflix movies or TV shows based on genre, cast, director, and description.

Objective

Build a content-based recommendation system that suggests similar Netflix titles.

Tools & Technologies Used

Python, Pandas, NumPy, Scikit-learn, CountVectorizer, Cosine Similarity, Pickle, Google Colab.

Project Workflow

1. Load dataset.
2. Clean missing values.
3. Select important columns.
4. Create tags column.
5. Apply CountVectorizer.
6. Calculate Cosine Similarity.
7. Generate Top 10 recommendations.
8. Save model using Pickle.

Result

The system successfully recommends similar movies and TV shows based on content similarity.

Conclusion

This project improved my understanding of recommendation systems, feature engineering, and text similarity. In future, I will integrate it with React and FastAPI.
